Task # 02

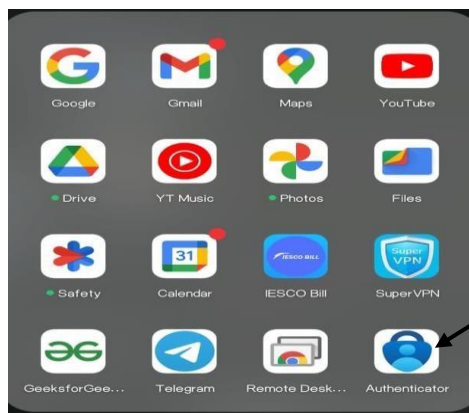

Implementing Multi-Factor Authentication

1. Objective:

Increase account security by implementing MFA

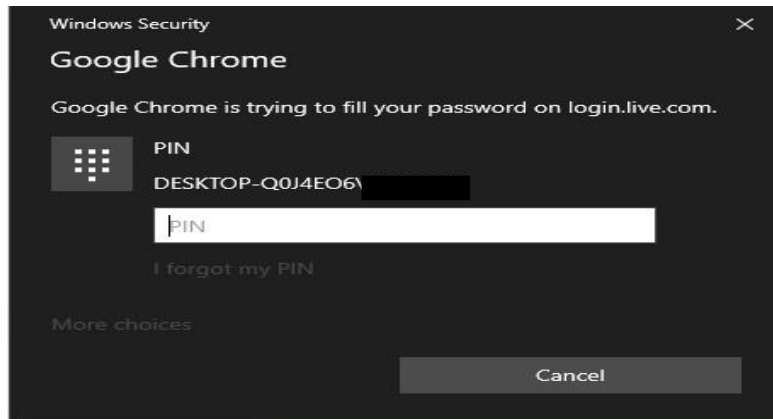

2. Solution:

- First we have to download Microsoft Authenticator on mobile phone.

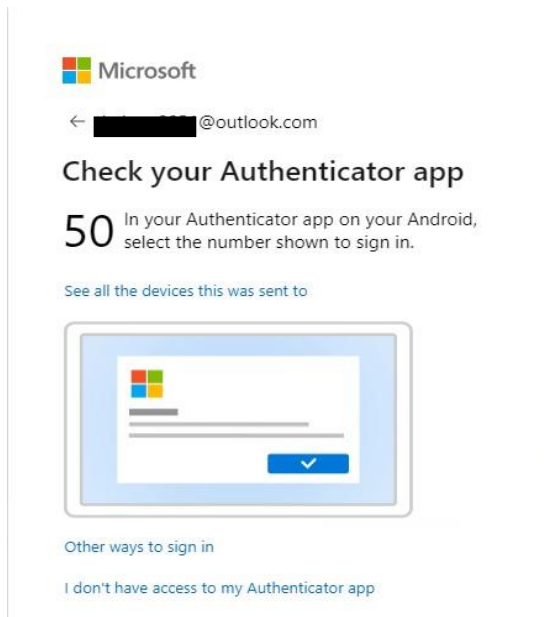

Use this for MFA authentication

- Second you have to login email in Microsoft Authentication, after that your email logged in this Application now you can change security according to your own need.
- It will also take permission from system as well as due to MFA authentication, after entering pin it will allow the user to enter email.

- After that we have to open Authenticator App on mobile phone, and match the number shown On app and click on **“Approve”**.

- After clicking on **“Approve”** it will allow user to login with that email with the help of MFA Authentication System.
