Vulnerability Scan Report

prepared by

HostedScan Security

HostedScan Security

Overview

1 Executive Summary	2
2 Vulnerabilities By Target	3
3 Passive Web Application Vulnerabilities	5
4 Glossary	13

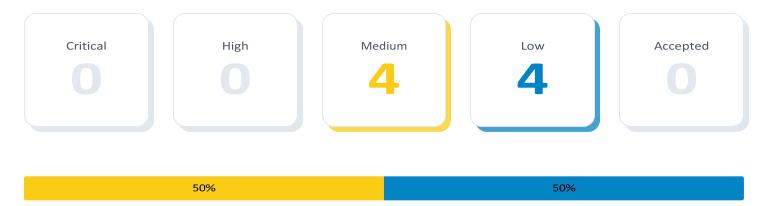

Executive Summary

1 Executive Summary

Vulnerability scans were conducted on select servers, networks, websites, and applications. This report contains the discovered potential vulnerabilities from these scans. Vulnerabilities have been classified by severity. Higher severity indicates a greater risk of a data breach, loss of integrity, or availability of the targets.

1.1 Total Vulnerabilities

Below are the total number of vulnerabilities found by severity. Critical vulnerabilities are the most severe and should be evaluated first. An accepted vulnerability is one which has been manually reviewed and classified as acceptable to not fix at this time, such as a false positive detection or an intentional part of the system's architecture.

1.2 Report Coverage

This report includes findings for 1 target scanned. Each target is a single URL, IP address, or fully qualified domain name (FQDN).

Vulnerability Categories

8
Passive Web Application Vulnerabilities

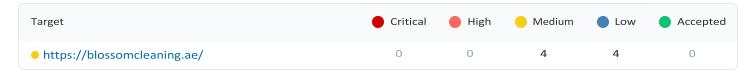

Vulnerabilities By Target

2 Vulnerabilities By Target

This section contains the vulnerability findings for each scanned target. Prioritization should be given to the targets with the highest severity vulnerabilities. However, it is important to take into account the purpose of each system and consider the potential impact a breach or an outage would have for the particular target.

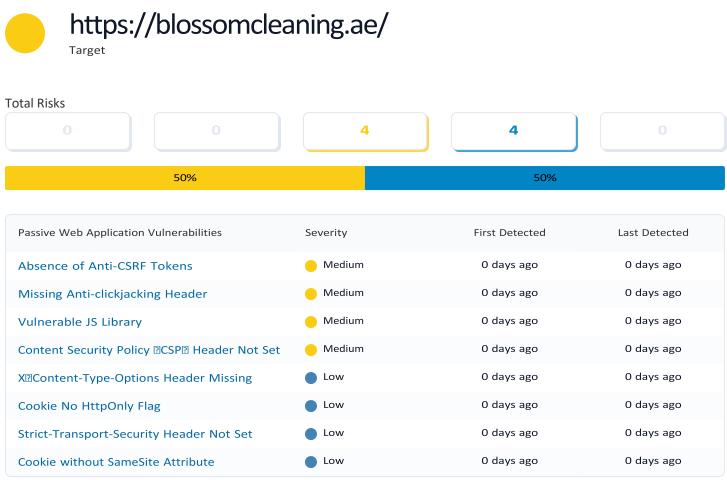

2.1 Targets Summary

The number of potential vulnerabilities found for each target by severity.

2.2 Target Breakdowns

Details for the potential vulnerabilities found for each target by scan type.

Passive Web Application Vulnerabilities

3 Passive Web Application Vulnerabilities

The OWASP ZAP Passive Web Application scan crawls the pages of a website or web application. The passive scan inspects each page as well as the requests and responses sent between the server. The passive scan checks for vulnerabilities such as cross-domain misconfigurations, insecure cookies, vulnerable Javascript dependencies, and more.

3.1 Total Vulnerabilities

Total number of vulnerabilities found by severity.

3.2 Vulnerabilities Breakdown

Summary list of all detected vulnerabilities.

Title	Severity	Open	Accepted
Absence of Anti-CSRF Tokens	Medium	1	0
Missing Anti-clickjacking Header	Medium	1	0
Vulnerable JS Library	Medium	1	0
Content Security Policy 2CSP2 Header Not Set	Medium	1	0
X Content-Type-Options Header Missing	Low	1	0
Cookie No HttpOnly Flag	Low	1	0
Strict-Transport-Security Header Not Set	Low	1	0
Cookie without SameSite Attribute	Low	1	0

Passive Web Application Vulnerabilities | Absence of Anti-CSRF Tokens

3.3 Vulnerability Details

Detailed information about each potential vulnerability found by the scan.

Absence of Anti-CSRF Tokens

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Medium

1 target

0 days ago

Description

No Anti-CSRF tokens were found in a HTML submission form.

A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a target destination without their knowledge or intent in order to perform an action as the victim. The underlying cause is application functionality using predictable URL/form actions in a repeatable way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust that a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and sea surf.

CSRF attacks are effective in a number of situations, including:

- * The victim has an active session on the target site.
- * The victim is authenticated via HTTP auth on the target site.
- * The victim is on the same local network as the target site.

CSRF has primarily been used to perform an action against a target site using the victim's privileges, but recent techniques have been discovered to disclose information by gaining access to the response. The risk of information disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.

Solution

Phase: Architecture and Design

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.

For example, use anti-CSRF packages such as the OWASP CSRFGuard.

Phase: Implementation

Ensure that your application is free of cross-site scripting issues, because most CSRF defenses can be bypassed using attackercontrolled script.

Phase: Architecture and Design

Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon receipt of the form. Be sure that the nonce is not predictable (CWE-330). Note that this can be bypassed using XSS.

Identify especially dangerous operations. When the user performs a dangerous operation, send a separate confirmation request to ensure that the user intended to perform that operation.

Passive Web Application Vulnerabilities | Absence of Anti-CSRF Tokens

Note that this can be bypassed using XSS.

Use the ESAPI Session Management control.

This control includes a component for CSRF.

Do not use the GET method for any request that triggers a state change.

Phase: Implementation

Check the HTTP Referer header to see if the request originated from an expected page. This could break legitimate functionality, because users or proxies may have disabled sending the Referer for privacy reasons.

Instances 21 of 1002 uri:

https://blossomcleaning.ae/

method: GET

evidence: <form role="search" method="get" class="search-form" action="https://blossomcleaning.ae/">

otherinfo: No known Anti-CSRF token [anticsrf, CSRFToken, __RequestVerificationToken, csrfmiddlewaretoken, authenticity_token,

OWASP_CSRFTOKEN, anoncsrf, csrf_token, _csrf, _csrfSecret, __csrf_magic, CSRF, _token, _csrf_token, data[_Token][key]] was found in the following HTML form: @Form 12 "s"].

Passive Web Application Vulnerabilities | Missing Anti-clickjacking Header

Missing Anti-clickjacking Header

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Medium

1 target

0 days ago

Description

The response does not include either Content-Security-Policy with 'frame-ancestors' directive or X-Frame-Options to protect against 'ClickJacking' attacks.

Solution

Modern Web browsers support the Content-Security-Policy and X-Frame-Options HTTP headers. Ensure one of them is set on all web pages returned by your site/app.

If you expect the page to be framed only by pages on your server (e.g. it's part of a FRAMESET) then you'll want to use SAMEORIGIN, otherwise if you never expect the page to be framed, you should use DENY. Alternatively consider implementing Content Security Policy's "frame-ancestors" directive.

Instances 21 of 1002 uri:

https://blossomcleaning.ae/ method: GET param: xframe-options

Passive Web Application Vulnerabilities | Vulnerable JS Library

Vulnerable JS Library

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Medium

1 target

0 days ago

Description

The identified library moment.js, version 2.29.3 is vulnerable.

Solution

Please upgrade to the latest version of moment.js.

Instances 21 of 32 uri: https://blossomcleaning.ae/wp-

content/plugins/ameliabooking/v3/public/assets/customerPanel.bd9ec78e.js method: GET evidence:

.version="2.29.3",p(Pe),r.fn=\$,r.min=so,r.max=ro,r.now=io,r.utc=V,r.unix=Ys,r.months=zs,r.isDate=T,r.locale=Au,r.invalid=K,r.duration=iu,r.isMome nt= otherinfo: CVE\(\text{CVE} \) 2022\(\text{B} \) 31129 CVE\(\text{B} \) 2023\(\text{B} \) 2023\(\text{B} \) 22467

Passive Web Application Vulnerabilities | Content Security Policy 2CSP2 Header Not Set

Content Security Policy (CSP) Header Not Set

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Medium

1 target

0 days ago

Description

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Solution

Ensure that your web server, application server, load balancer, etc. is configured to set the Content-Security-Policy header.

Instances 21 of 1002 uri:

https://blossomcleaning.ae/

method: GET

Vulnerable Target	First Detected	Last Detected
https://blossomcleaning.ae/	0 days ago	0 days ago

Passive Web Application Vulnerabilities | X2 Content-Type-Options Header Missing

X-Content-Type-Options Header Missing

SEVERITY AFFECTED TARGETS LAST DETECTED

Low 1 target 0 days ago

Description

The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.

Solution

Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages.

If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application/web server to not perform MIME-sniffing.

Instances 21 of 1002 uri:

https://blossomcleaning.ae/

method: GET

param: x-content-type-options

otherinfo: This issue still applies to error type pages ②401, 403, 500, etc.) as those pages are often still affected by injection issues, in which case there is still concern for browsers sniffing pages away from their actual content type. At "High" threshold this scan rule will not alert on client or server error responses.

Passive Web Application Vulnerabilities | Cookie No HttpOnly Flag

Cookie No HttpOnly Flag

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Low

1 target

0 days ago

Description

A cookie has been set without the HttpOnly flag, which means that the cookie can be accessed by JavaScript. If a malicious script can be run on this page then the cookie will be accessible and can be transmitted to another site. If this is a session cookie then session hijacking may be possible.

Solution

Ensure that the HttpOnly flag is set for all cookies.

Instances 21 of 1002 uri: https://blossomcleaning.ae/product/white-detergent-

10/%7B%7B%20data.rtwpvg_video_embed_url%20%7D%7D method: GET

param: woocommerce_cart_hash evidence: set-

cookie: woocommerce_cart_hash

References

Vulnerable Target	First Detected	Last Detected
https://blossomcleaning.ae/	0 days ago	0 days ago

Passive Web Application Vulnerabilities | Strict-Transport-Security Header Not Set

Strict-Transport-Security Header Not Set

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Low

1 target

0 days ago

Description

HTTP Strict Transport Security (HSTS) is a web security policy mechanism whereby a web server declares that complying user agents (such as a web browser) are to interact with it using only secure HTTPS connections (i.e. HTTP layered over TLS/SSL). HSTS is an IETF standards track protocol and is specified in RFC 6797.

Solution

Ensure that your web server, application server, load balancer, etc. is configured to enforce Strict-Transport-Security.

Instances 21 of 1002 uri:

https://blossomcleaning.ae/

method: GET

Vulnerable Target	First Detected	Last Detected
https://blossomcleaning.ae/	0 days ago	0 days ago

Passive Web Application Vulnerabilities | Cookie without SameSite Attribute

Cookie without SameSite Attribute

SEVERITY

AFFECTED TARGETS

LAST DETECTED

Low

1 target

0 days ago

Description

A cookie has been set without the SameSite attribute, which means that the cookie can be sent as a result of a 'cross-site' request. The SameSite attribute is an effective counter measure to cross-site request forgery, cross-site script inclusion, and timing attacks.

Solution

Ensure that the SameSite attribute is set to either 'lax' or ideally 'strict' for all cookies.

Instances 21 of 1002 uri: https://blossomcleaning.ae/product/white-detergent-

10/%7B%7B%20data.rtwpvg_video_embed_url%20%7D%7D method: GET

param: woocommerce_cart_hash evidence: set-

cookie: woocommerce_cart_hash

Glossary

4 Glossary

Accepted Vulnerability

An accepted vulnerability is one which has been manually reviewed and classified as acceptable to not fix at this time, such as a false positive scan result or an intentional part of the system's architecture.

Fully Qualified Domain Name PFQDNP

A fully qualified domain name is a complete domain name for a specific website or service on the internet. This includes not only the website or service name, but also the top-level domain name, such as .com, .org, .net, etc. For example, 'www.example.com' is an FQDN.

Passive Web Application Vulnerabilities

The OWASP ZAP Passive Web Application scan crawls the pages of a website or web application. The passive scan inspects each page as well as the requests and responses sent between the server. The passive scan checks for vulnerabilities such as cross-domain misconfigurations, insecure cookies, vulnerable Javascript dependencies, and more.

Vulnerability

A weakness in the computational logic (e.g., code) found in software and hardware components that, when exploited, results in a negative impact to confidentiality, integrity, or availability. Mitigation of the vulnerabilities in this context typically involves coding changes, but could also include specification changes or even specification deprecations (e.g., removal of affected protocols or functionality in their entirety).

Target

A target represents target is a single URL, IP address, or fully qualified domain name <code>PQDN</code> that was scanned.

Severity

Severity represents the estimated impact potential of a particular vulnerability. Severity is divided into 5 categories: Critical, High, Medium, Low and Accepted.

CVSS Score

The CVSS 3.0 score is a global standard for evaluating vulnerabilities with a 0 to 10 scale. CVSS maps to threat levels: 0.1 ② 3.9 ② Low 4.0 ② 6.9 ② Medium 7.0 ② 8.9 ② High 9.0 ② 10.0 ② Critical
